

Pump Protection & Fault Analysis Report

2026-08-31 14:12 to 2026-09-01 14:12 | Granularity: Hourly

Generated 2026-09-01 14:12:17

System Health Index	57 / 100	Fair — attention recommended
---------------------	----------	------------------------------

Uptime	Total Fault Incidents	Total Downtime	MTTR (avg clear time)	Total Run Hours
85.63%	879	1h 33m	6s	3.0 h

Top Priority Issues — What to Check First

#1 Dry Run — 871 incidents, 1h 27m downtime (repeat offender — recurring cluster detected)

Remedy: Check the pump wire connection and water level. Also check the dry run % setting.

#2 Under Voltage — 7 incidents, 6m downtime (repeat offender — recurring cluster detected)

Remedy: Check incoming supply voltage with a multimeter. R-Y, Y-B, B-R should read 360–480 VAC, and R-N, Y-N, B-N should read approx. 200–240 VAC.

#3 Over Voltage — 1 incidents, 0s downtime

Remedy: Check incoming supply voltage with a multimeter. R-Y, Y-B, B-R should read 360–480 VAC, and R-N, Y-N, B-N should read approx. 200–240 VAC.

Note: 70 snapshots in this period had an unrecognized data format (likely from an earlier logging version) and were excluded from fault statistics to keep counts accurate. Electrical readings from those snapshots are unaffected.

Fault Frequency & Downtime Breakdown

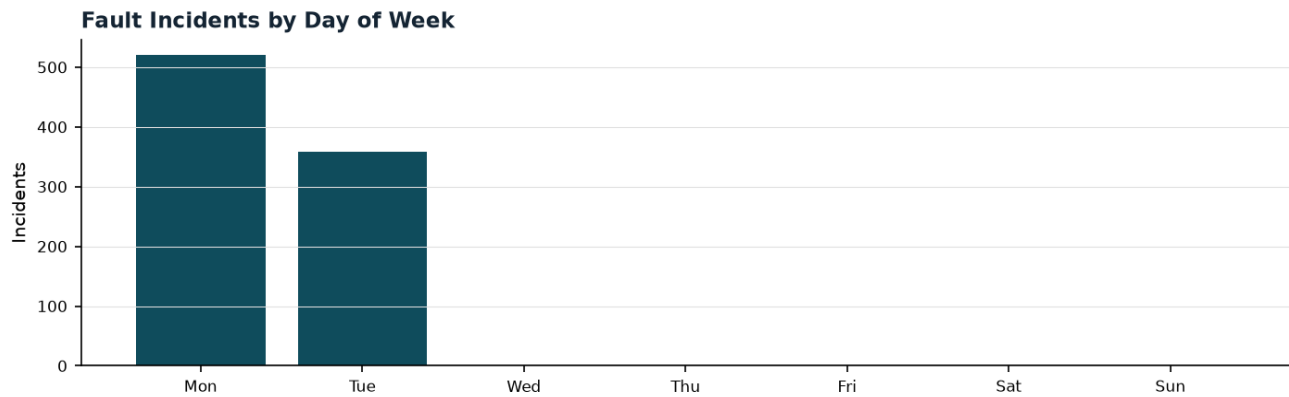

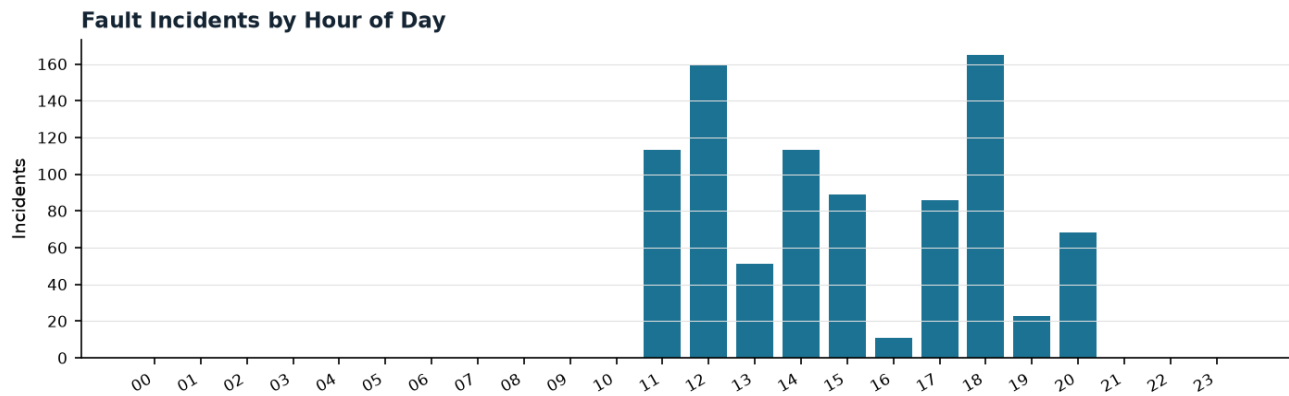

Fault	Cnt	Downtime	Avg Clear	Longest	Active	Remedy
Dry Run	871	1h 27m	7s	23m	132	Check the pump wire connection and water level. Also check the dry run % setting.
Under Voltage	7	6m	1m	4m	2	Check incoming supply voltage with a multimeter. R-Y, Y-B, B-R should read 360–480 VAC, and R-N, Y-N, B-N should read approx. 200–240 VAC.
Over Voltage	1	0s	--	--	1	Check incoming supply voltage with a multimeter. R-Y, Y-B, B-R should read 360–480 VAC, and R-N, Y-N, B-N should read approx. 200–240 VAC.

Repeat-Offender Clusters (same fault firing repeatedly)

Fault	Occurrences	Cluster Start	Cluster End
Dry Run	322	2026-09-01 11:23	2026-09-01 13:15
Dry Run	274	2026-08-31 17:21	2026-08-31 19:08
Dry Run	170	2026-08-31 14:33	2026-08-31 16:16
Dry Run	68	2026-08-31 20:06	2026-08-31 20:28
Dry Run	37	2026-09-01 13:59	2026-09-01 14:10
Under Voltage	7	2026-08-31 15:24	2026-08-31 16:43

A cluster indicates the same fault fired multiple times within a short window — usually a sign the underlying cause was not fully resolved between trips.

Fault Timing Patterns

Root-Cause Incident Log

Every fault incident below is paired with the electrical/tank readings recorded closest to the moment it started, so you can see WHY it tripped, not just that it did.

Fault	Started	Cleared	Duration	Readings at Trip
Dry Run	2026-09-01 14:10:40	ONGOING	--	V: 414.6/415.6/412.8 I: 4.86/5.12/4.99

Electrical Parameter Analysis

Parameter	Min	Max	Average	Unit
Voltage R-Y	0.00	521.00	414.20	V
Voltage B-R	0.00	521.00	414.07	V
Voltage Y-B	0.00	522.00	414.16	V
Current R Phase	0.00	8.20	5.16	A
Current Y Phase	0.00	8.30	5.17	A
Current B Phase	0.00	8.30	5.17	A

Metric	Value
Voltage Phase Imbalance	0.03%
Current Phase Imbalance	0.17%

Configured Setpoints (period average — check Settings page for current live value)

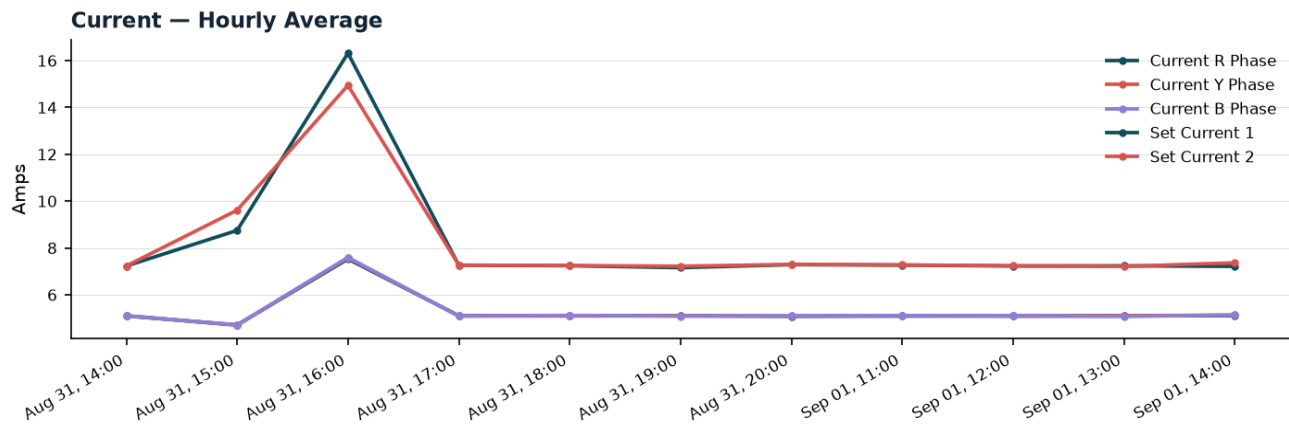

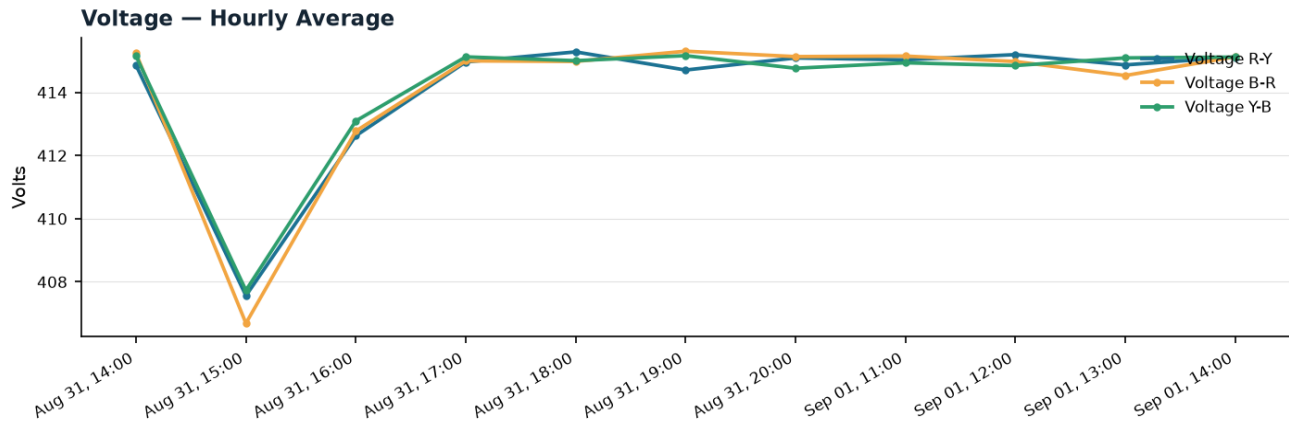

Setpoint	Average Value	Unit
Set ON Time	25.16	min
Set OFF Time	23.63	min
Set Current 1	7.79	A
Set Current 2	7.83	A
Set Dry-Run Current	49.69	%

Near-Miss Warning Counts (concerning but did not trip a fault)

Near-Miss Type	Occurrences
Voltage below 380V	36
Voltage above 450V	7
Voltage phase imbalance warning-zone	0
Current phase imbalance warning-zone	7424

Near-misses are readings that entered a warning zone without triggering a hard fault — a frequent count here can be an early indicator of a developing problem.

Hourly Trend — Voltage & Current (Average)

Operational & Duty Cycle Analysis

Metric	Value
Pump 1 — Total Run Time	0s
Pump 2 — Total Run Time	2h 57m
Estimated Start/Stop Cycles	9

Operation Mode Distribution (raw control_auto_manual register values — device-specific codes, see Settings page for your device's mode mapping)

Mode Value	Snapshot Count
102	7342
51	82

Tank Sensor Behavior

Sensor Event	Times Triggered
Bottom Tank — Low Sensor Triggered	4933
Bottom Tank — High Sensor Triggered	2690
Top Tank — Low Sensor Triggered	4674
Top Tank — High Sensor Triggered	2397

Dry Run & Bottom Tank Correlation: 1.4% of Dry Run fault snapshots (14 of 1014) occurred while the Bottom Tank Low sensor was also triggered — a weak correlation, worth investigating other causes (wiring, sensor calibration) for the remaining incidents.
